

Mid North Coast Region Middle Brother National Park Fire Management Strategy (Type 2) 2005

Sheet 1 of 1

This strategy should be used in conjunction with aerial photography and field reconnaissance during incidents and the development of incident action plans.

Operational Guidelines	
Refer to Strategy for Fire Management 2003 and Fire Management Manual 2004.	
Brief all personnel involved in suppression operations on the following issues:	
Resource	<ul style="list-style-type: none"> Two sites exist within the Park, but are not directly affected by fire or fire fighting activities If new sites are located consult with a senior NPWS officer. No known sites in Reserve. If new sites located consult with a senior NPWS officer.
Aboriginal Cultural Heritage Site Management (NPWS FMM 4.11)	<ul style="list-style-type: none"> Two sites exist within the Park, but are not directly affected by fire or fire fighting activities If new sites are located consult with a senior NPWS officer.
Historic Heritage Management (NPWS FMM 4.10)	<ul style="list-style-type: none"> FA - Wildlife rescue program to be implemented when IC declares it safe to undertake onground rescue operations As far as possible, protect large and hollow-bearing trees in locations where these species are known to occur. As far as possible avoid high intensity fires that consume canopies and fallen logs in locations where these species are known to occur. If new sites are located consult with a senior NPWS officer.
Threatened Fauna Management (NPWS FMM 4.12 & 5.2)	<ul style="list-style-type: none"> FA - Wildlife rescue program to be implemented when IC declares it safe to undertake onground rescue operations As far as possible, protect large and hollow-bearing trees in locations where these species are known to occur. As far as possible avoid high intensity fires that consume canopies and fallen logs in locations where these species are known to occur. If new sites are located consult with a senior NPWS officer.
Threatened Flora Management (NPWS FMM 4.12)	<ul style="list-style-type: none"> FL - (<i>Acacia courtilii</i>) Avoid the use of earth moving machinery in locations where these species are known to occur. As far as possible avoid high intensity fires that consume canopies and fallen logs in locations where these species are known to occur. If new sites are located consult with a senior NPWS officer.
Threatened Property	<ul style="list-style-type: none"> Where possible property owners with assets at risk from a wildfire event should be kept informed regarding the progress of the fire; and asked for an assessment of their current level of asset protection preparedness.
General	<ul style="list-style-type: none"> The use of bombing aircraft should support ground based suppression crews and containment operations by aggressively attacking hotspots and spot-overs. Ground crews must be alerted to water bombing operations.
Aerial Water Bombing (NPWS FMM 4.4 / NSW Fire Agencies Aviation SOPs O2 / NPWS Guidelines for Effective Aircraft Management)	<ul style="list-style-type: none"> Aerial ignition may be used during back-burning or fuel reduction operations where practicable, but only with the prior consent of a senior NPWS officer. Utilise incendiaries to rapidly progress back-burns down slope where required.
Aerial Ignition (NPWS FMM 4.2.20 & 4.4 / NSW Fire Agencies Aviation SOPs O2.4 / NPWS Guidelines for Effective Aircraft Management)	<ul style="list-style-type: none"> Temperature and humidity trends must be monitored carefully to determine the safest times to implement back-burns. Generally, when the FDI is Very High or greater, backburning should commence when the humidity begins to rise in the late afternoon or early evening. With a lower FDI backburning may be safely undertaken during the day. Where practicable, clear a 1m radius around dead and fibrous barked trees adjacent to containment lines prior to backburning, or wet down these trees as part of the backburn ignition. Avoid ignition of backburns at the bottom of slopes where a long and intense up slope burn is likely.
Backburning (NPWS FMM 4.8)	<ul style="list-style-type: none"> The first combatant agency on site may assume control of the fire, but then must ensure the relevant land management agency is notified promptly. On the arrival of other combatant agencies, the initial incident controller will consult with regard to the ongoing command, control and incident management team requirements as per the relevant BFMIC Plan of Operations. No new containment lines will be constructed except where they can be constructed by hand and will have minimal erosion potential. New containment lines require the prior consent of a senior NPWS officer. Most fire trails will benefit from a low impact surface clearing/sweeping Where practicable, containment lines should be stabilised and rehabilitated as part of the wildfire suppression operation.
Command & Control (NPWS FMM 4.2)	<ul style="list-style-type: none"> The first combatant agency on site may assume control of the fire, but then must ensure the relevant land management agency is notified promptly. On the arrival of other combatant agencies, the initial incident controller will consult with regard to the ongoing command, control and incident management team requirements as per the relevant BFMIC Plan of Operations. No new containment lines will be constructed except where they can be constructed by hand and will have minimal erosion potential. New containment lines require the prior consent of a senior NPWS officer. Most fire trails will benefit from a low impact surface clearing/sweeping Where practicable, containment lines should be stabilised and rehabilitated as part of the wildfire suppression operation.
Containment Lines (NPWS FMM 2.2 & 3.9)	<ul style="list-style-type: none"> Earthmoving equipment may only be used with the prior consent of a senior NPWS officer, and then only if the probability of its success is high. Earthmoving equipment must be always guided and supervised by an experienced officer, and accompanied by a support vehicle. When engaged in direct or parallel attack this vehicle must be a firefighting vehicle. Earthmoving equipment should be washed down, where practicable, prior to it entering NPWS estate.
Earthmoving Equipment (NPWS FMM 4.2.20 & 4.3)	<ul style="list-style-type: none"> All fire advantages used during wildfire suppression operations must be mapped and where relevant added to the database. Wetting and foaming agents (surfactants) are permitted for use in wildfire suppression. The use of fire retardant is only permitted with the prior consent of the senior NPWS officer, and should be avoided where reasonable alternatives are available. Exclude the use of surfactants and retardants within 50m of rainforest, watercourses, dams and swamps. Areas where fire suppression chemicals are used must be mapped and the used products name recorded. The Threatened Species Operational Guidelines are to be observed. Where practicable, containment lines should be stabilised and rehabilitated as part of the wildfire suppression operation. The potential impacts of smoke and possible mitigation tactics must be considered when planning for wildfire suppression and prescribed burning operations. If smoke becomes a hazard on local roads or highways, the police, RTA, LGA and relevant media must be notified. Smoke management must be in accordance with relevant RTA traffic management guidelines. The reserve may be closed to the public during periods of extreme fire danger or during wildfire suppression operations.
Fire Advantage Recording (NPWS FMM 4.2.20 & 4.9)	<ul style="list-style-type: none"> All fire advantages used during wildfire suppression operations must be mapped and where relevant added to the database. Wetting and foaming agents (surfactants) are permitted for use in wildfire suppression. The use of fire retardant is only permitted with the prior consent of the senior NPWS officer, and should be avoided where reasonable alternatives are available. Exclude the use of surfactants and retardants within 50m of rainforest, watercourses, dams and swamps. Areas where fire suppression chemicals are used must be mapped and the used products name recorded. The Threatened Species Operational Guidelines are to be observed. Where practicable, containment lines should be stabilised and rehabilitated as part of the wildfire suppression operation. The potential impacts of smoke and possible mitigation tactics must be considered when planning for wildfire suppression and prescribed burning operations. If smoke becomes a hazard on local roads or highways, the police, RTA, LGA and relevant media must be notified. Smoke management must be in accordance with relevant RTA traffic management guidelines. The reserve may be closed to the public during periods of extreme fire danger or during wildfire suppression operations.
Fire Suppression Chemicals (NPWS FMM 4.2.20 & 4.9)	<ul style="list-style-type: none"> All fire advantages used during wildfire suppression operations must be mapped and where relevant added to the database. Wetting and foaming agents (surfactants) are permitted for use in wildfire suppression. Vegetation

Status of Fire Thresholds

Fire Thresholds	
Overburnt	Fire thresholds have been exceeded. - Protect from fire as far as possible. - The area will be Overburnt if it burns this year.
Vulnerable	- Protect from fire as far as possible. - The area is close to its threshold and may become overburnt with the absence of fire.
Recently Burnt	- Avoid fires if possible.
Within Threshold	Fire history is within the threshold for vegetation in this area. - A burn is neither required nor should one necessarily be avoided.
Almost Underburnt	The area is close to its threshold and may become underburnt with the absence of fire. - A prescribed burn may be advantageous. Consider allowing unplanned fires to burn.
Underburnt	Fire frequency is below fire thresholds in the area. - A prescribed burn may be advantageous. Consider allowing unplanned fires to burn.
Unknown	Insufficient data to determine fire threshold.

NB. Fire thresholds are defined for vegetation communities to conserve biodiversity

Service	Channel	Location and Comments
NPWS - VHF	9	Channel 1 as alternate
NPWS - VHF (Fireground Comms)	41	Channel 33 as alternate
NPWS - VHF (Portable Repeater)	13	Held at Hastings Depot in Port Macquarie.
RFS - PMR - UHF	28	Channel 55 (Comboyne) or 63 (Cairncross) as alternate.
RFS - GRN		Not Available
SP - VHF	32	NPWS Equivalent Channel 91
CB - UHF	12	
Aircraft - VHF	No	N/A
Mobile Phone - CDMA	Yes	
Mobile Phone - GSM	Yes	

Strategy Information	
Fire Season Information	
Wildfires	<ul style="list-style-type: none"> Have been known to start as early as late August, but usually the potential for a large fire event is greatest between October and December. This period may extend into January in more severe years. General season is Autumn to late Winter. Burning is possible in early Spring but not desirable on a regular basis from an ecological point of view.
Prescribed Burning (NPWS Fire Management Manual 4.7)	<ul style="list-style-type: none"> Where practicable consider maximising the fire area in accordance with the requirements of any proposed prescribed burns. Where practicable consider maximising the fire area in accordance with the requirements of any proposed prescribed burns.
